

Job Title: AI Solutions Architect

Location: Remote (US) | Department: Engineering | Type: Full-time

About the Role

We're looking for an AI Solutions Architect to design and deploy production-grade AI and automation systems for our clients — spanning LLM application architecture, workflow automation, and cloud infrastructure. You'll work closely with engineering and business stakeholders to translate requirements into scalable, reliable solutions.

Core Requirements

- 5+ years of experience in AI/ML engineering, solutions architecture, or automation engineering.
- Hands-on experience building LLM-powered applications (LangChain, agent frameworks, or equivalent).
- Strong cloud infrastructure experience (AWS, GCP, or Azure) including deployment and cost optimization.
- Experience with workflow automation platforms (n8n, Zapier, Make, or similar) is a strong plus.
- Proficiency in Python and REST API design.
- Track record of leading technical projects end-to-end, from design through production deployment.

Nice to Have

- Experience with Infrastructure-as-Code (Terraform).
- Prior client-facing or consulting experience.
- Familiarity with CI/CD pipelines for ML deployment.

What Success Looks Like

Within the first 6 months, this person will have designed and shipped at least one production automation or AI system, and will be a trusted technical voice in client-facing architecture discussions.
